

Zepto Sales Analysis

SQL + Power BI Project

Project Overview

This project focuses on analyzing sales, delivery, and inventory operations for a Zepto-style quick-commerce business using SQL and Power BI.

The objective of the project was to generate business insights related to revenue trends, delivery performance, inventory monitoring, and return analysis through interactive dashboards and SQL-based KPI analysis.

Problem Statement

Quick-commerce companies need to efficiently manage sales performance, delivery operations, and inventory availability to improve customer satisfaction and operational efficiency.

This project analyzes operational data to identify trends, monitor KPIs, and support data-driven business decisions.

Project Objectives

- Analyze sales and revenue trends
 - Monitor delivery performance
 - Identify low-stock products
 - Track return rates
 - Build interactive dashboards for business insights
-

Tools & Technologies Used

Tool	Purpose
SQL (MySQL)	Data analysis and KPI calculation
Power BI	Dashboard development and visualization
CSV Dataset	Data source

Dataset Description

The dataset contains simulated quick-commerce transactional data including:

- Sales information
- Product categories
- Inventory details
- Delivery performance
- Product returns

Key Columns Used

Column Name	Description
order_id	Unique order identifier
order_date	Date and time of order
product_name	Product purchased
category	Product category
quantity	Units sold
revenue	Revenue generated
stock_level	Current inventory level
reorder_level	Minimum required stock
delivery_partner	Delivery agent/company
delivery_time_min	Delivery time in minutes
delivery_status	Delivery status
return_flag	Product return indicator

SQL Analysis Performed

- Imported and structured transactional sales dataset in MySQL
- Used SQL queries for KPI analysis and operational insights
- Performed data aggregation using SUM(), AVG(), COUNT(), and GROUP BY
- Analyzed revenue trends, delivery performance, inventory levels, and return rates

- Identified top-selling products and high-performing categories
- Calculated business KPIs such as:
 - Total Revenue
 - Total Orders
 - Late Delivery Percentage
 - Average Delivery Time
 - Return Percentage
 - Low Stock Products

Power BI Dashboards

1. Sales Dashboard

Included:

- Total Revenue
- Total Orders
- Revenue Trends
- Top Categories
- Top Products

Purpose:

To monitor sales performance and identify high-performing products and categories.

2. Delivery Dashboard

Included:

- Average Delivery Time
- Late Delivery Percentage
- Delivery Partner Performance
- On-Time Delivery Analysis

Purpose:

To evaluate delivery efficiency and operational performance.

3. Inventory Dashboard

Included:

- Stock vs Reorder Level
- Low Stock Products
- Return Analysis

Purpose:

To monitor inventory health and identify products requiring replenishment.

Key Insights

- Identified top-performing product categories based on revenue
- Analyzed delivery partner efficiency using delivery KPIs
- Monitored products nearing stockout levels
- Tracked return trends across product categories
- Created operational dashboards for business monitoring

Conclusion

This project demonstrates the use of SQL and Power BI to analyze and visualize operational data for a quick-commerce business.

The dashboards provide insights into sales performance, delivery efficiency, and inventory management while strengthening practical skills in SQL querying, dashboard development, and business analytics.
